Abstract

In job the rare case of radiation diagnostic described at patient with histiocytosis from cells of Langerhans. With complex survey of radiation methods diagnostic multifocal defeat of bones was revealed. On MRI-tomogram of hip, knee and talocrural joints zone of bone marrow edema are revealed. The open biopsy of internal condyle of right tibia, by the result of histological research histiocytosis of cells of Langerhans is exhibited. On base of immunohistochemical research with the uses antibodies to CD1a, S-100, Langerin, CD68(PG-M1), morphological picture and clinical data no-langerhans cell histiocytosis illness of Erdheim–Chester is exhibited.

Key words: Langerhans Cell Histiocytosis, Erdheim – Chester Disease, Joints, Rentgenographiya, Magnetic Resonance Imaging, Multispiral Computer Tomographiya.
