Abstract

Conducted a survey of 41 patients with long flowing chronic opisthorchiasis. In the absence of jaundice changes in the biliary tract were detected at 83,7 % of patients. At patients with chronic opisthorchiasis complicated by obstructive jaundice changes of cholangioarchitectonics detected at 100 % of cases. The results of different imaging studies are estimated. The most informative were magnetic resonance cholangiopancreatography and endoscopic retrograde cholangiopancreatography. According to research were identified five types of architectonic of biliary tract at chronic opisthorchiasis. Characteristic of chronic opisthorchiasis cholangioarchitectonics changes were biliary stricture with dilatation overlying ducts, cholangioectasis and sclerosing cholangitis.

Key words: Magnetic Resonance Cholangiopancreatography, Complications of Chronic Opisthorchiasis, Obstructive Jaundice.
