Abstract

In article, on the basis of the review of literary and own data, the analysis of features of use of system of reports ATLS is carried out at radiologic evaluation and polytrauma treatment. Universality and high efficiency of application of algorithms ATLS is shown at a polytrauma without dependence from a kind and set of damages. ATLS does not contradict the Russian standards of rendering of medical aid at a combined trauma, it is widely used in working out of algorithm of actions of the medical personnel of Omsk city clinical hospital of the first help № 1. Introduction of the given system in the Russian Federation will allow to reduce at a polytrauma lethality.

Key words: Polytrauma, Radiologic Evaluation, ATLS.
