

Ultrasound Detection of Subdural Hemorrhage in a Newborn (Case Report)

N. M. Dubasova, Yu. A. Alexandrov

Irkutsk Clinical Children Hospital, Department of Radiology

Abstract

We report on a rare clinical case of ultrasound diagnosis of small convexity and infratentorial subdural hemorrhages in neonate with hereditary hematogenic thrombophilia. In addition to traditional cranial ultrasonography through the anterior fontanelle we use alternative imaging techniques (different transducer types and frequencies and scanning through the additional acoustic windows). CT images confirmed cranial US findings.

Key words: Newborns, Ultrasonography, Subdural Hemorrhage.
