### Abstract

The main idea of the article: to classify the significance of diagnostic of avascular necrosis of the femoral head in the early stages to keep the hip joint using minimally invasive surgery techniques. Within 3 years, 67 patients with clinically and radiologically diagnosed with osteonecrosis of the femoral head, at different stages were checked. Complex radiation survey included radiography and spiral computer tomography (CT) hip to diagnose early stage avascular necrosis. According to a survey for the year 9 patients in the early stages of aseptic necrosis of the femoral head held minimally invasive operational surgery with the help of osteoreplacing special stuff.

**Key words:** Avascular Necrosis, Hip Joint, Osteoreplacing Special Stuff, Roentgenography.
