Vishnevsky Central Military Clinical Hospital, Ministry of Defense of Russia

Abstract

Presented clinical observation of successful minimally invasive treatment of abscesses of the right kidney arising from the obstruction of the right ureter stone. The diagnosis of acute purulent right-sided pyelonephritis, stones of the right kidney and the stone right ureter confirmed by ultrasound and computed tomography. Based on the data of radiation surveys conducted manipulation to restore the flow of urine and elimination of purulent foci under radiation control. After the acute inflammatory process performed endoscopic removal of stone right ureter and right kidney stones. Dynamic radiation monitoring confirmed the efficacy of minimally invasive treatment.

Key words: Ultrasonography, X-ray Fluoroscopy, Computed Tomography, Abscess of Kidney, Puncture Treatment.
