Abstract

The aim of the study was to analyze the results of radiography in wards performed in 2 multidisciplinary hospitals. 800 X-rays for 2016 were studied. It was determined that 74 % falls on the diseases of the chest organs. In 22 % of the pathology was not revealed. Other diseases are 4 %. The most frequent diseases of chest are stagnation in a small circle of blood circulation, hydrothorax and pneumonia. Medical requirements for X-ray equipment for shooting in these conditions were determined on the basis of clinical need and modern technologies.

Key words: Non-specialized Conditions, X-ray in Wards.
