Abstract

The article describes the possibilities of the X-ray method in the diagnostic search for diseases of the thorax in patients observed in the Department of Thoracic Surgery Moscow Clinical Municipal Children Hospital St. Vladimir, Department of Health Care of Moscow. Are presented the use of computed tomography (CT) with bolus contrast for the detection of a rare organ pathology of chest in children — the anomaly of the bronchopulmonary system and the formation of the mediastinum.

Key words: Spiral Computed Tomography with Contrast Enhancement, Thoracic Surgery, Children.
