Abstract

In cases of multiple bilobar lesions of the liver, in the absence of the possibility of surgical treatment, one of the methods of treatment is polychemotherapy which carrying out requires not only biochemical control, but also control of using the capabilities of radiological diagnostic methods. Magnetic resonance imaging allows conducting a dynamic comparison of tumors with regard to generally accepted recommendations. In the arsenal of the method there are also techniques, the data of which are not included in the well-known recommendations, the use of which can make a contribution to the conclusion of the study.

Key words: Magnetic Resonance Imaging, Diffusion-Weighted Images, Colorectal Liver Metastases.
